(1) Hard drawn, bare copper cable.
(2) Hard drawn, bare all-aluminum cable.
(3) "Compresto" all-aluminum cable, by Olin Conductors Division.
(4) Standard, aluminum cable steel reinforced.
(5) Standard, aluminum cable steel reinforced (aluminum coated steel core wire(s)).
(6) Aluminum cable steel reinforced, Compresto ACSR by Olin Conductors Division.
(7) High strength all-aluminum cable, "AAAC" by Kaiser Aluminum.
(8) High strength all-aluminum cable, by Reynolds Metals Company.
(9) Alumoweld cable by Copperweld Steel Company.

(1) Hard drawn, bare copper cable.
(2) Hard drawn, bare all-aluminum cable.
(3) "Compresto" all-aluminum cable, by Olin Conductors Division.
(4) Standard, aluminum cable steel reinforced.
(5) Standard, aluminum cable steel reinforced (aluminum coated steel core wire(s)).
(6) Aluminum cable steel reinforced, Compresto ACSR by Olin Conductors Division.
(7) High strength all-aluminum cable, "AAAC" by Kaiser Aluminum.
(8) High strength all-aluminum cable, by Reynolds Metals Company.
(9) Alumoweld cable by Copperweld Steel Company.

(1) Hard drawn, bare copper cable.
(2) Hard drawn, bare all-aluminum cable.
(3) "Compresto" all-aluminum cable, by Olin Conductors Division.
(4) Standard, aluminum cable steel reinforced.
(5) Standard, aluminum cable steel reinforced (aluminum coated steel core wire(s)).
(6) Aluminum cable steel reinforced, Compresto ACSR by Olin Conductors Division.
(7) High strength all-aluminum cable, "AAAC" by Kaiser Aluminum.
(8) High strength all-aluminum cable, by Reynolds Metals Company.
(9) Alumoweld cable by Copperweld Steel Company.

(1) Hard drawn, bare copper cable.
(2) Hard drawn, bare all-aluminum cable.
(3) "Compresto" all-aluminum cable, by Olin Conductors Division.
(4) Standard, aluminum cable steel reinforced.
(5) Standard, aluminum cable steel reinforced (aluminum coated steel core wire(s)).
(6) Aluminum cable steel reinforced, Compresto ACSR by Olin Conductors Division.
(7) High strength all-aluminum cable, "AAAC" by Kaiser Aluminum.
(8) High strength all-aluminum cable, by Reynolds Metals Company.
(9) Alumoweld cable by Copperweld Steel Company.

* 1,020	20	.....	.....	.....	.....	.....	.....	7	.0121	.036	19	.0073	.037	.....	.....	.....

* The sizes of conductors which have been marked with an asterisk provide for one or more schedules of preferred series, and are commonly used in the industry. The sizes not marked are given simply as a matter of reference and it is suggested that their use be discouraged.

** At present the prevailing practice in the industry is to supply 7-wire (class AA) cables for A.W.G. Nos. 000 and 0000 weather-resisting (weatherproof) conductors, unless the application requires a more flexible stranding.

(a) To calculate the nominal diameters of any concentric-lay-stranded conductors made from round wires of uniform diameters, multiply the diameter of an individual wire by that one of the following factors which applies:

NUMBER OF WIRES IN THE CONDUCTOR	FACTOR TO CALCULATE CONDUCTOR DIAMETER
3	2.155
7	3
12	4.155
19	5
37	7
61	9
91	11
127	13

*This table shows a variety of strand constructions that are useful and generally adequate to meet the needs encountered. It is not intended that the constructions listed in this table be exclusive of other constructions that may appear desirable in certain applications employing the same total numbers of wires. The constructions shown in this table provide for a finished, non-covered, stranded conductor approximately of the area indicated. When specified by the purchaser, usually to provide additional area to compensate for draw-down during subsequent processing, the size of the wires composing the non-covered conductor may be increased as required.

Cable diameters and weights abstracted from ASTM Designation: B8-60.

Breaking Strain=0.90 x A x S, where A=total area of cable and S=tensile strength of an individual wire according to ATSM Designation B1-56.

The thermal coefficient of linear expansion is 0.0000094 per degree Fahrenheit.

The final modulus of elasticity is 17,000,000 pounds per square inch.

*Anaconda Publication No. C-51

The resistances are for nominal sizes, and are based on a conductivity of **97.5%** IACS. Resistance is increased **2%** to allow for stranding, except in the case of 3-wire cable where the allowance is **1%**.

Temperature Conversion:

$R_{t_o} = R_{20}\ [1 + 0.00383(T_o - 20)]$ Where R_{t_o} = Resistance at operating temperature, °C.
R_{20} = Resistance at 20°C.
T_o = Operating temperature, °C.

The inductive and capacitive reactance are calculated for an equivalent spacing of one foot. For other spacings the total reactance is the sum of the reactance at one foot spacing plus reactance spacing factor, Table 74, Page 67.

The current ratings are approximate based on the following conditions: Copper conductivity 98.0% I.A.C.S.; aluminum conductivity 61.0% I.A.C.S.; average temperature rise 30°C. above ambient temperature 40°C; frequency 60 cycles; horizontal position; outdoors; and wind velocity 2 feet per second crosswise. Conductors should be spaced at least 18 inches apart; otherwise, use "Relative Current Carrying Capacities Due To Proximity Effect", Table 69, Page 61.

*AnaConda Publication No. C-51.

Modulus of Elasticity: Strand, 23,000,000. Coefficient of Linear Expansion: .000,007,2 per degree Fahrenheit.
Temperature Coefficient of Resistance: .0021 per degree Fahrenheit.

*Breaking loads of 7-wire, 19-wire and 37-wire Copperweld Strands are taken as 90% of the sum of the breaking loads of the individual wires; breaking load of 3-wire Copperweld Strand is taken as 95% of the sum of the breaking loads of the individual wires used in the manufacturing of the strand.

Tube dimensions taken from A.S.T.M. Specification B-42-33:

Tabular values based on a density of 0.322 pound per cubic inch; conductivity of 98.0% I.A.C.S. at 20°C., or 68°F., elastic limit of 16,000 pounds per square inch; tensile strength for pipe of outside diameter up to 4" incl., 40,000 pounds per square inch; outside diameter over 4", 38,000 pounds per square inch. These are minimum values for Anaconda High-Conductivity, Hard-Drawn Copper Bus Tubes.

† 1 Microhm=0.000001 ohm.

Above Deflections Calculated by Beam Formula $D = \frac{5WL^4}{384EI}$

D=Deflection in Inches.
W=Weight in Lbs. Per Inch.
L=Span in Inches.

The deflections tabulated above are for buses simply supported. The deflections for fixed buses are 1/5 the values given.

The deflection varies as the 4th power of the span length. In order to obtain the deflection for any span not shown in the tabulation, multiply the table value for the 10 foot span by 10^{-4} times the 4th power of the new span length in feet.

E=Mod. Elastic $=16\times10^6$ For Cu.

I=Moment of Inertia $=\frac{\pi}{64}(d_1^4-d_2^4)$

d_1=OD of Tube
d_2=ID of Tube

$D_1 = D(l^4\times10^{-4})$

D_1=Deflection in new Span in Inches.
D=Deflection in 10 Ft. Span in Inches.
l=New Span Length in Feet.

DEFLECTION FACTORS

Factors $l^4 \times 10^{-4}$ For Spans From 5 Ft. to 31 Ft.

NOTES: Tubular values based on: Density of 0.322 pound per cubic inch,
Conductivity of 98.0% I.A.C.S. at 20°C. or 68°F.
98.0% is minimum value for High Conductivity Hard-Drawn or Rolled Copper Bus Channels and Angles.
Minimum tensile strength, hard-drawn or rolled=32,000 pounds per sq. in.

*1 microhm=0.000 001 ohm. Direct current resistance at 20°C.
Amperes capacity for 60 cycles, 40°C. ambient, bus not enclosed. D.C. capacity about 20-25% greater.
Maximum deviation in outside dimension less than 1%; in thickness, .03 inch.

NOTE: Skin effect ratio, R'/R is same as for unventilated square tubes, Pages 24 and 25.

*See basis of calculations, Page 71.

Table 25

*CURRENT RATINGS FOR BARE CABLES AND WIRES, OUTDOORS, FOR COPPER, A.C.S.R., AND ALL-ALUMINUM CONDUCTORS

The arrangement of this table affords convenient selection of A.C.S.R. and all-aluminum conductors which are equivalents of copper conductors in 60-cycle current ratings.

COPPER		A.C.S.R.		ALL-ALUMINUM

*These current ratings are approximate based on the following conditions: Copper conductivity 98.0% I.A.C.S.; aluminum conductivity 61.0% I.A.C.S.; average temperature rise 30°C. above ambient temperature 40°C.; frequency 60 cycles; horizontal position; outdoors; and wind velocity 2 feet per second crosswise. Conductors should be spaced at least 18 inches apart; otherwise, use "Relative Current Carrying Capacities Due To Proximity Effect", Table 69, Page 61.

ROME CABLE DIVISION OF ALCOA

Class AA stranding is usually specified for bare conductors used on overhead lines. Class A stranding is usually specified for conductors to be covered with weather-resistant (weatherproof) materials and for bare conductors where greater flexibility than afforded by Class AA is required.

ROME CABLE DIVISION OF ALCOA

Continued on Page 31

Class B stranding is usually specified for conductors to be insulated with various materials such as rubber, paper, varnished cloth, etc. Class C stranding is specified for conductors where greater flexibility than provided by Class B is required.

*Based on Copper 97 percent, Aluminum 61 percent conductivity.

†For conductor at 75°C., air at 25°C., wind 1.4 miles per hour (2 ft./sec.) frequency=60 cycles.

‡"Current Approx. 75% Capacity" is 75% of the "Approx. Current Carrying Capacity in Amps." and is approximately the current which will produce 50°C. conductor temp. (25°C. rise) with 25°C. air temp., wind 1.4 miles per hour.

**Standard Weight Coating

① These conductors have a high ratio of mechanical strength to current-carrying capacity. They are used largely for overhead ground wires and for special construction such as river crossing spans. Generally speaking they are of interest for any application where mechanical requirements are of primary importance.

* Aluminum and steel ultimate strength are within 1% of values calculated in accordance with A.S.T.M. Standard Specification B-232-60T.

*The Utilities Grade is used principally by communication and power and light industries.
**Also called Specification Grade. Can be furnished to conform to Western Union and A. T. & T. specifications.

① Ratings based on 30°C rise over 40°C ambient in still but unconfined air; conductors horizontal; conductor spacing sufficient to eliminate proximity effect; normal oxidized surface, indoors (e=0.35).

② For multiple bar arrangements, the space between bars equal to the bar thickness.

③ EC – 61% IACS minimum.

④ No. 2 EC-T61 – 57% IACS minimum.

S=Separation Between Conductor Center Lines.

Table 70

FORCES ON BUSES DUE TO SHORT CIRCUIT CURRENTS

Max. Force "F" in Lbs. Per Ft.	Short Circuit Current I	Type of Fault	Configuration	Force on Conductor
$F=K\frac{5.4I^2X10^{-7}}{d}$	DC			+ or −
$F=K\frac{10.8I^2X10^{-7}}{d}$	RMS Symmetrical	Single Phase Symmetrical		A or B
$F=K\frac{43.2I^2X10^{-7}}{d}$	RMS Symmetrical	Single Phase Asymmetrical		A or B
$F=K\frac{34.9I^2X10^{-7}}{d}$	RMS Symmetrical	Three Phase Asymmetrical		A or C
$F=K\frac{37.5I^2X10^{-7}}{d}$	RMS Symmetrical	Three Phase Asymmetrical		B
$F=K\frac{37.5I^2X10^{-7}}{d}$	RMS Symmetrical	Three Phase Asymmetrical		A, B or C

F=Maximum lateral force between conductors (either attractive or repulsive) in pounds per linear foot of conductor.

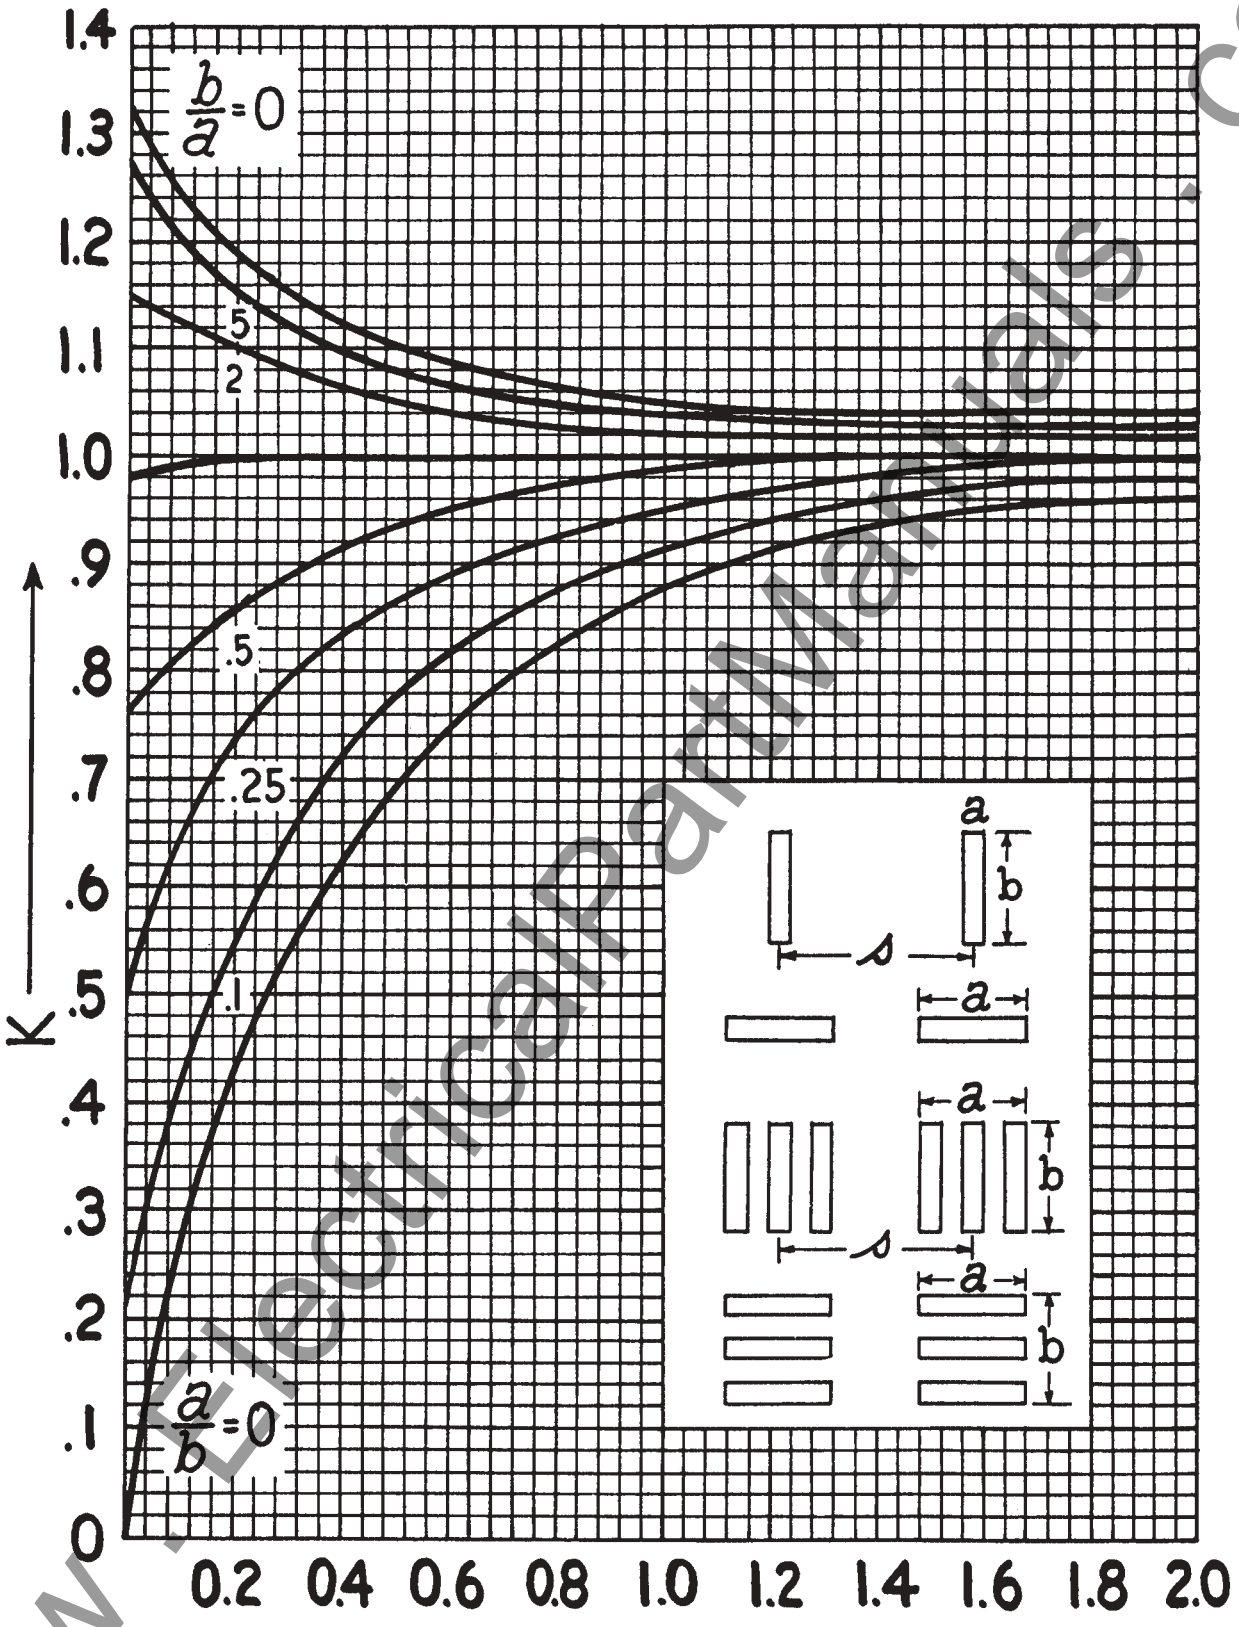
K=Shape correction factor (see table on page 63) important only where the dimensions of the conductors are relatively large compared with the distances between the conductors. K=1 for round conductors.

I=Short circuit current—in the equations for the AC circuits I represents the RMS value of the symmetrical wave short circuit current.

d=Conductor spacing in inches—center to center.

The above equations are based upon the formula $f=\frac{i_1 \times i_2}{d}$ in which the quantities are in cgs units; the force "f" in Dynes per centimeter, the current "i" in absolute amperes, the distance "d" in centimeters.

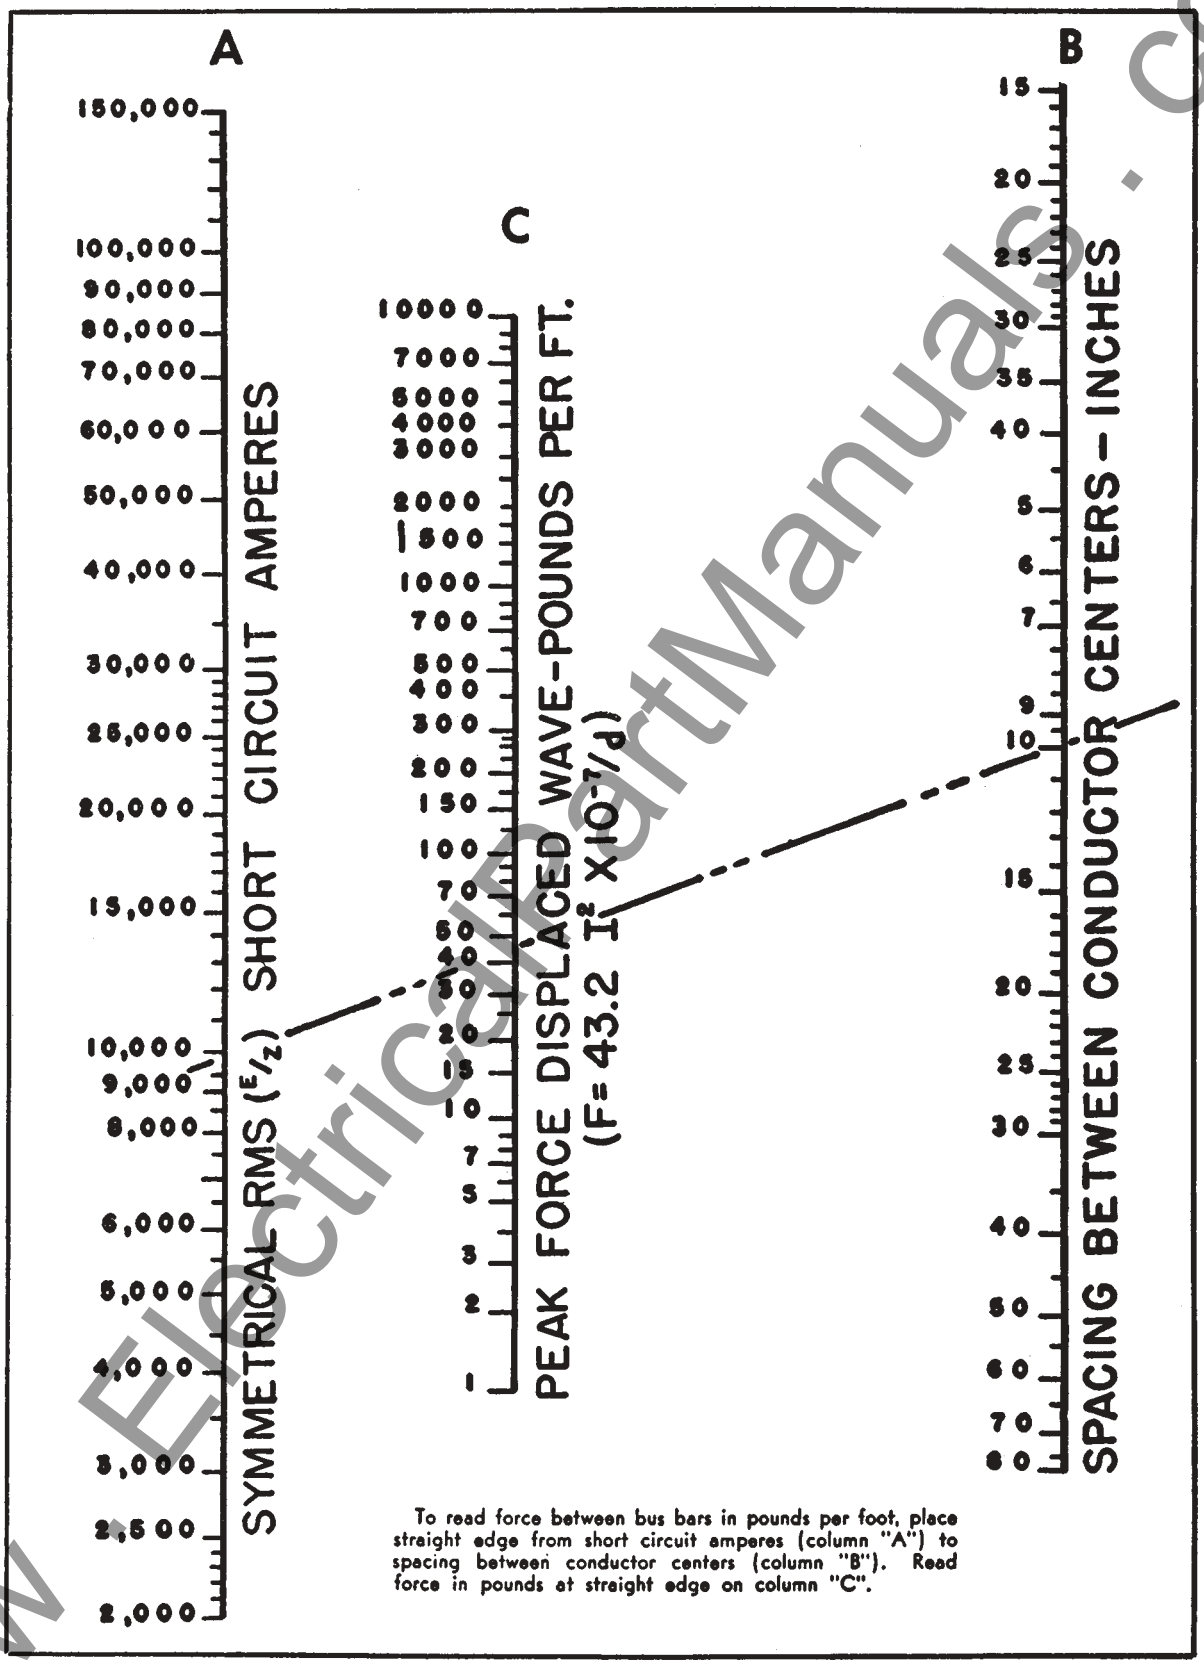
SHAPE CORRECTION FACTOR "K" FOR RECTANGULAR COPPER BARS*



NOTE: The numbers placed against each curve in the figure are values of $\frac{a}{b}$ except in the case of top curve, for which $\frac{b}{a}=0$.

*Chase Brass and Copper Company.

CHART FOR DETERMINING MAXIMUM SHORT CIRCUIT FORCE IN BUSES

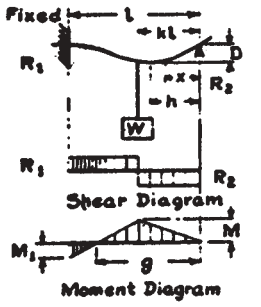


To read force between bus bars in pounds per foot, place straight edge from short circuit amperes (column "A") to spacing between conductor centers (column "B"). Read force in pounds at straight edge on column "C".

The American Brass Company.

BEAM FORMULAE FOR HORIZONTAL BUSES

Concentrated Loads - Bus Taps - Jumpers.
Load at any point - one end fixed, one end supported.



$R_1 = \frac{Wk(3-k^2)}{2}$ $R_2 = \frac{W(2-3k+k^3)}{2}$

$W\,max = \frac{2fS}{kl(2-3k+k^3)}$, if $k < .414$

$W\,max = \frac{2fS}{kl(1-k^2)}$, if $k > .414$

$D = \frac{Wkl^3(1-k^2)^3}{3(3-k^2)^2EI}$, if $k < .414$

$D = \frac{Wkl^3(k-1)^2\sqrt{\frac{k}{2+k}}}{6EI}$, if $k > .414$

$M = \frac{Wkl(2-3k+k^3)}{2}$

$M_1 = \frac{Wkl(1-k^2)}{2}$

$Mx = R_2x$, if $x < kl$

$Mx = R_2x - W(x-kl)$, if $x > kl$.

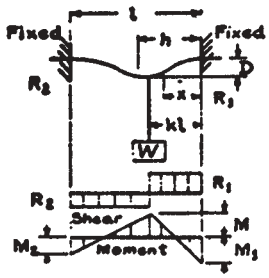
$g = \frac{2l}{(3-k^2)}$

$h = \frac{l(1+k^2)}{(3-k^2)}$, if $k < .414$

$h = l\sqrt{\frac{k}{(2+k)}}$, if $k > .414$

$D\,max = \frac{.0098Wl^3}{EI}$, if $k = .414$

Concentrated Loads - Bus Taps - Jumpers
Load at any point - both ends fixed



$R_1 = W(1-3k^2+2k^3)$ $R_2 = Wk^2(3-2k)$

$W\,max. = \frac{fS}{kl(1-k)^2}$, if $k < .5$

$D\,max = \frac{2Wk^2l^3(1-k)^3}{3EI(3-2k)^2}$, if $k < .5$

$h = \frac{l}{3-2k}$, if $k < .5$

$M = 2Wk^2l(1-k)^2$, if $k < .5$

$M_1 = Wkl(1-k)^2$, if $k < .5$

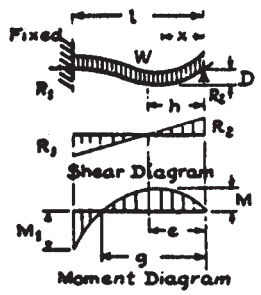
$M_2 = Wk^2l(1-k)$, if $k < .5$

$Mx = R_1x - M_1$, if $x < kl$

$Mx = R_2(1-x) - M_2$, if $x > kl$

$g = \frac{kl}{1+2k}$

Uniform Loads - Short Circuits - Ice - Wind
Load uniformly distributed - one end fixed, one end supported.



$R_1 = \frac{5W}{8}$ $R_2 = \frac{3W}{8}$

$Vx = \frac{W(3l-8x)}{8l}$

$W\,max. = \frac{8fS}{l}$

$D\,Max. = \frac{.0054Wl^3}{EI}$ $h = .422l$

$M = .07 \cdot Wl$

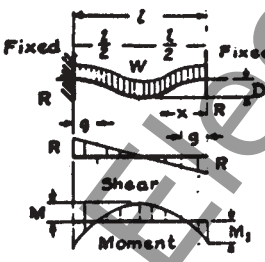
$M_1 = \frac{Wl}{8}$

$Mx = \frac{Wx(3l-4x)}{8l}$

$e = \frac{3l}{8}$

$g = \frac{3l}{4}$

Uniform Loads - Short Circuits - Ice - Wind
Load uniformly distributed - both ends fixed



$R = \frac{W}{2}$ $Vx = \frac{W}{2l}(l-2x)$

$W\,max. = \frac{12fS}{l}$

$D\,max. = \frac{Wl^3}{384EI}$

$M = \frac{Wl}{24}$

$M_1 = \frac{Wl}{12}$

$Mx = \frac{W}{12}\left(6x - l - \frac{6x^2}{l}\right)$

$g = .211l$

NOTATIONS:

R=Reaction, in pounds.
W=Superimposed Load, in pounds.
V=Vertical Shear, in pounds.
M=Bending Moment, in inch-pounds.
D=Deflection, in inches.
l=Length of Span, in inches.
k=Distance from end to load divided by span, in inches.
h=Distance from end to point of maximum deflection, in inches.
<=Is less than.
g=Distance from end to nearest point of zero moment, in inches.
e=Distance from end to point of maximum positive moment, in inches.
f=Bending Stress on extreme fiber, in pounds per square inch.
I=Moment of Inertia, in inches^4.
S=Section Modulus, in inches^3.
E=Modulus of Elasticity, in pounds per square inch.
>=Is greater than.

K_r — EARTH RESISTANCE FACTOR

Use 0.286 Ohms per Phase per Mile at 60 cps

K_e — EARTH REACTANCE FACTOR

Earth Resistivity Meter Ohms ρ	1	5	10	50	100	500	1000	5000	10000
				Ohms per Phase per Mile at 60 cps					
K_e	2.05	2.35	2.47	2.77	2.89	3.19	3.31	3.61	3.73

FORMULAE

1. Positive and negative sequence impedance (ordinary line-to-neutral constants) — $Z_1 = Z_2 = R + j(X_L + K_L)$
*2. Zero sequence impedance — $Z_0 = (R + K_r) + j(X_L + K_a - 2K_L)$
3. Positive and negative sequence shunt capacitive reactance (ordinary line-to-neutral constants) — $X_1 = X_2 = X_c + K_c$
4. Positive and negative sequence shunt capacitive susceptance (ordinary line-to-neutral constants) — $B_1 = B_2 = \frac{1}{X_c + K_c}$
5. Zero sequence shunt capacitive reactance — See "Symmetrical Components" by Wagner and Evans.

*Formula (2) gives the zero sequence impedance for a line without a ground wire. For corrections for the presence of ground wires, see method described by Wagner and Evans in "Symmetrical Components," or the method to be published by W. A. Lewis, Professor of Electrical Engineering, Cornell University.

EXAMPLE

Determine the positive and zero sequence impedance of hollow conductor design 50R2 at 60 cycles for 14-foot equivalent spacing, no ground wires, and earth resistivity of 100 meter ohms.

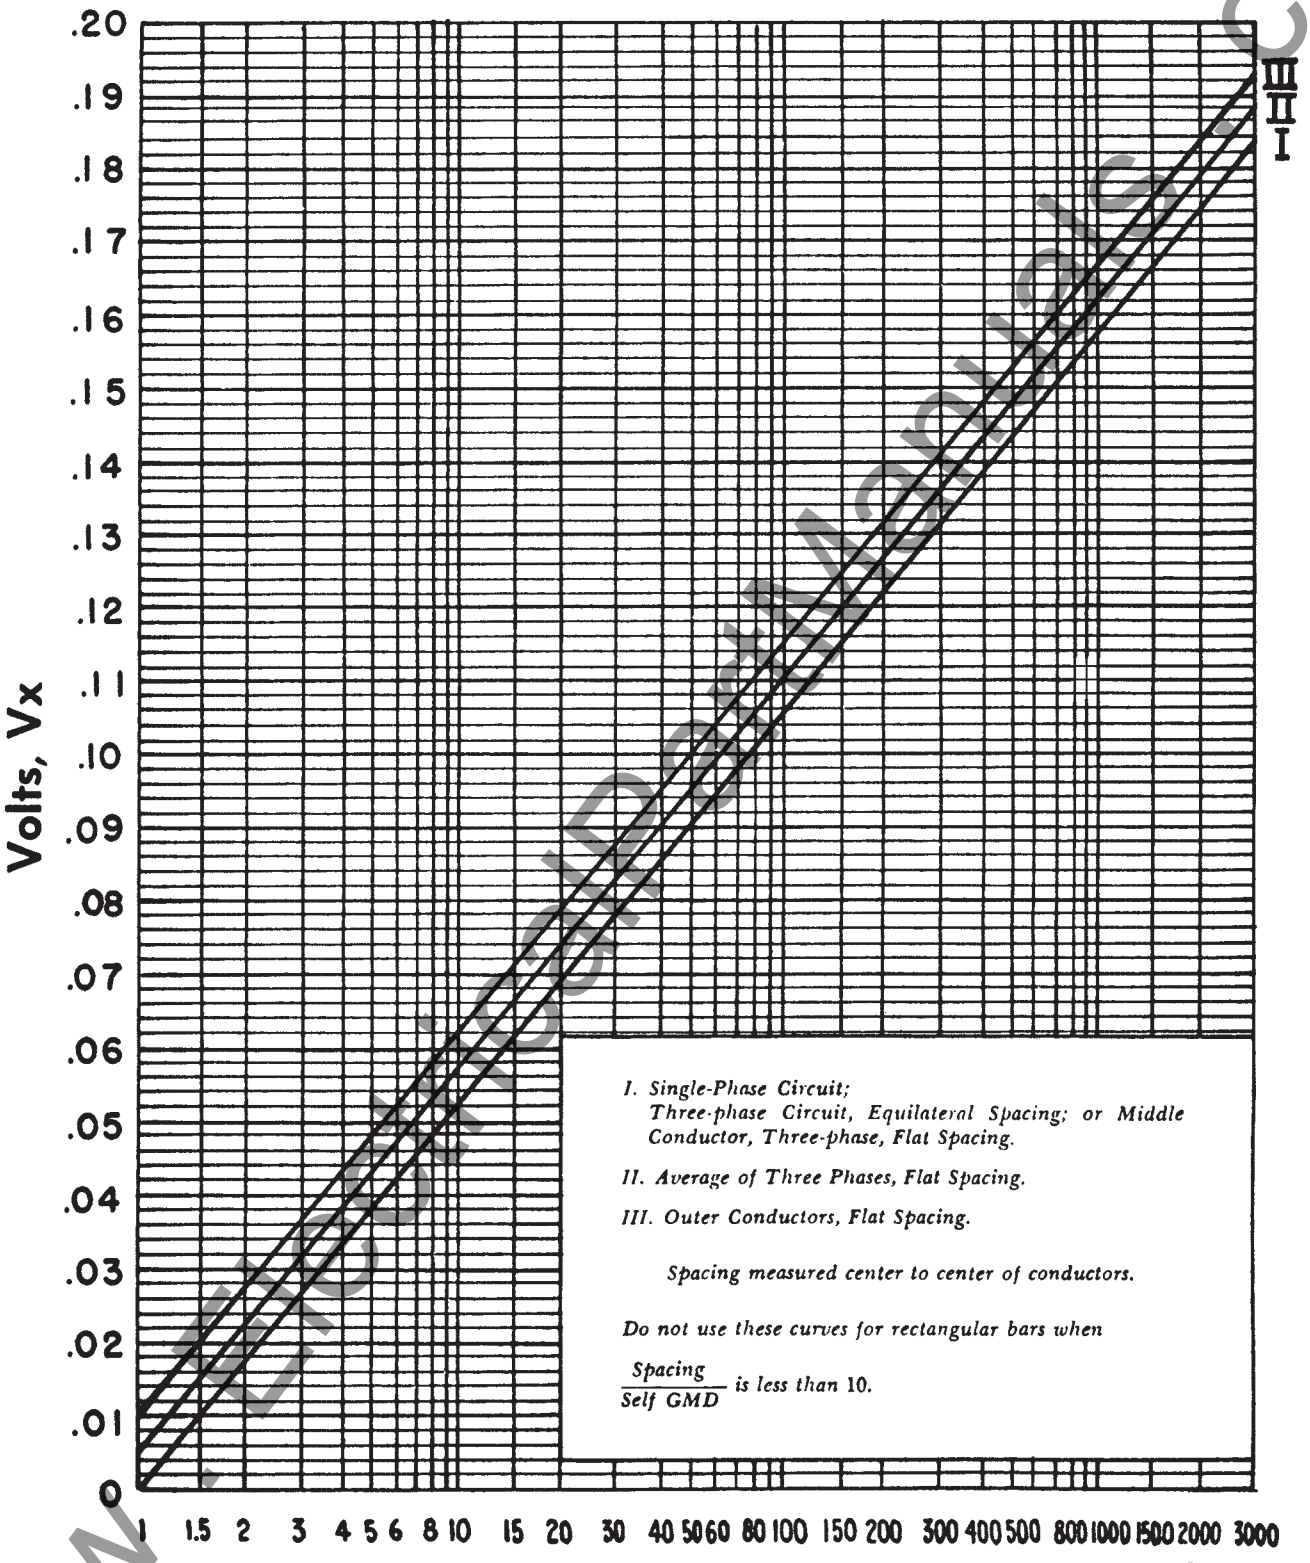
$R = 0.2756$ ohms/phase/mile
$X_L = 0.4554$ ohms/phase/mile
$K_L = 0.3202$ ohms/phase/mile
$K_r = 0.286$ ohms/phase/mile
$K_e = 2.89$ ohms/phase/mile

Positive sequence impedance: $Z_1 = R + j(X_L + K_L)$
$= 0.2756 + j0.7756$ (ohms/phase/mile)

Zero sequence impedance: $Z_0 = (R + K_r) + j(X_L + K_e - 2K_L)$
$= 0.5616 + j2.705$ (ohms/phase/mile)

Anaconda Wire and Cable Company.

REACTANCE VOLTS DROP TO NEUTRAL, PER FOOT TRANSMITTED, PER 1000 AMPERES, AT 60 CYCLES



NOTE: See Table 75, for tabulations of values of this chart.

Chase Brass and Copper Company.

Table 75

REACTANCE VOLTS DROP$_1$ V^x_1 TO NEUTRAL

Per Foot Transmitted, per 1000 Amperes, at 60 Cycles

(Equals reactance in ohms per 1000 ft. of conductor)

9.5	.0517	12	90	.1034	900	.1563		
Do not use this column for rectangular bars.		12	95	.1046	950	.1575		

For other frequencies, change in proportion to the frequency.

G=self geometric mean distance of the conductor (given in Bus conductor tables).

For single-phase circuits, three-phase circuits with equilateral spacing or for the middle conductor of three-phase circuits with flat spacing, the equivalent spacing is:

S=center to center spacing between conductors,

For the average drop to neutral, three-phase flat spacing,*

S=1.260 x spacing,

For the outer conductors, three-phase flat spacing,

S=approx. 1.5 x spacing.

See also page 70 for chart of these tabulated values. For greater accuracy, interpolate from values of table or calculate directly from the following formula:

$$V_x = .0529 \text{ Log}_{10} \frac{\text{Equiv. Spacing in inches}}{\text{Self GMD}}$$

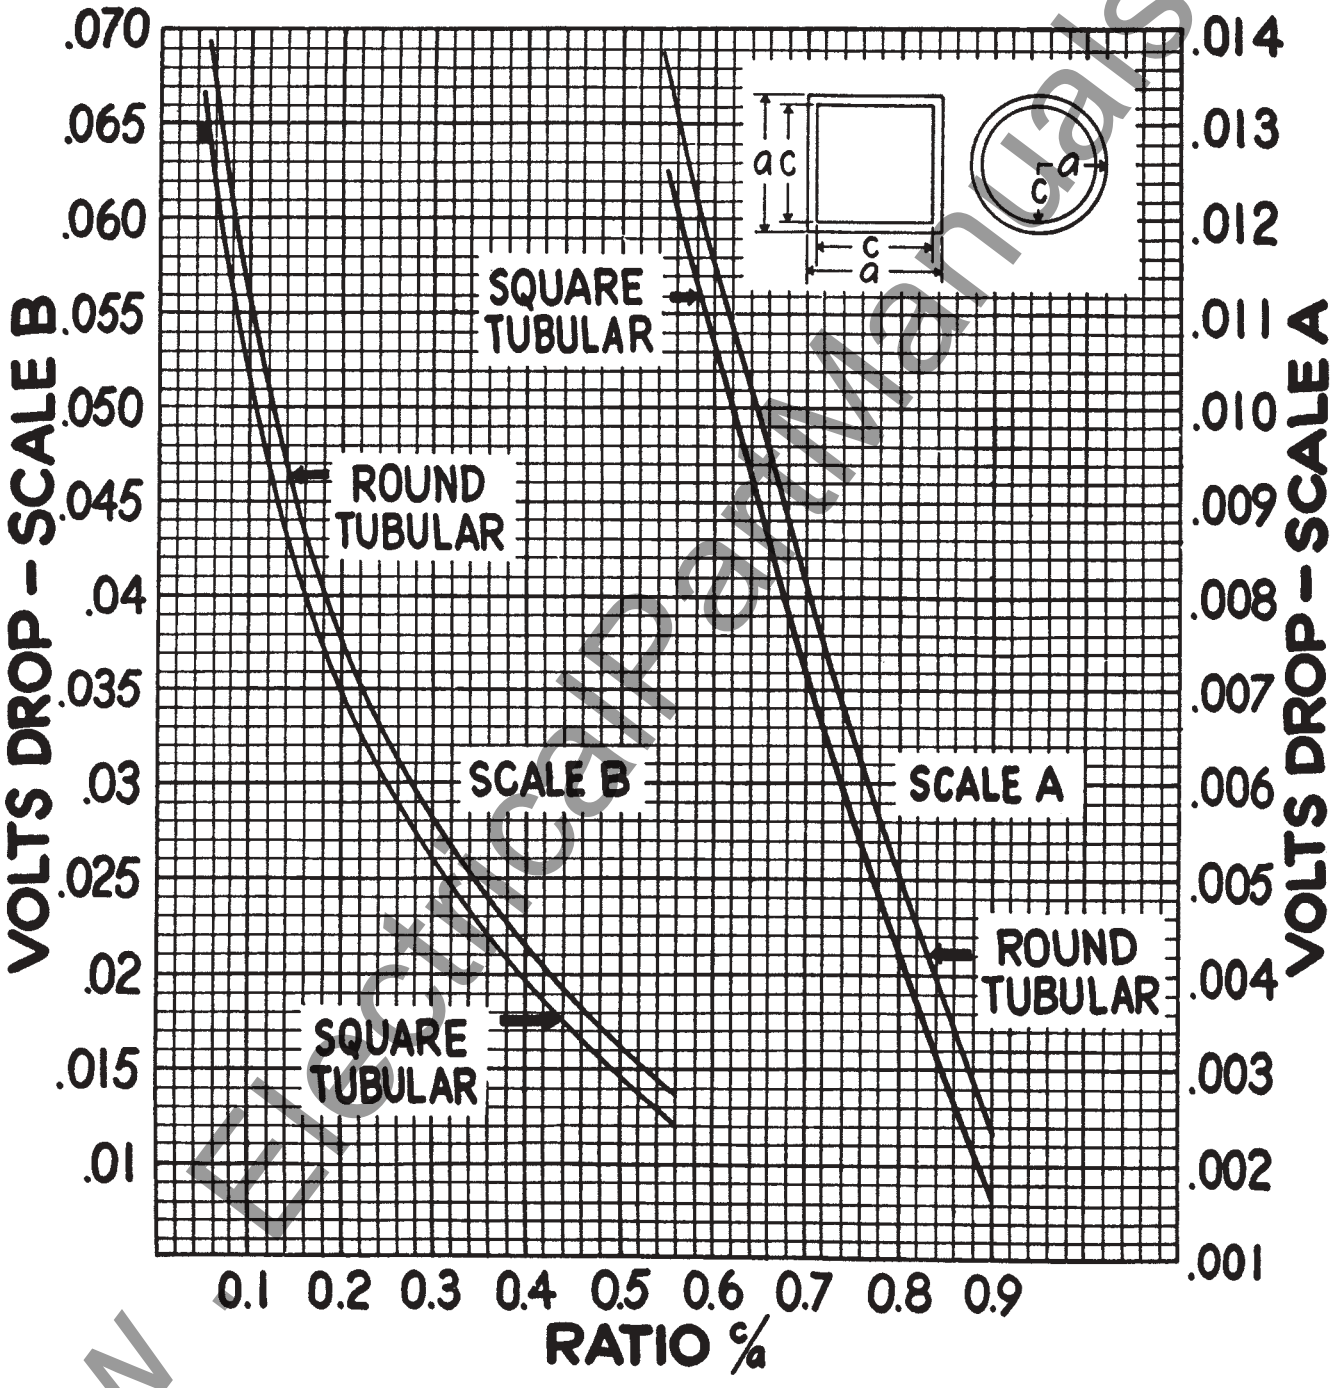
This method does not hold for rectangular bars when $\frac{\text{Spacing}}{\text{Self GMD}}$ is less than 10.

The reactance drop added vectorially to the straight resistance drop will give the total voltage drop in the conductor; for formulae, see Table 73, page 66.

Chase Brass and Copper Company.

SINGLE-PHASE, CONCENTRIC, SQUARE AND ROUND TUBULAR BUSES. REACTANCE VOLTS DROP PER FOOT OF BUS LENGTH, PER 1000 AMPERES AT 60 CYCLES

(Equals reactance in ohms per 1000 ft. of bus length)



Chase Brass and Copper Company.

BASIS OF CALCULATIONS FOR BUS CONDUCTOR TABLES*

Breaking strength is given for tensile strength of 40,000 lbs. per sq. in.

Yield strength is given at tensile stress of 25,000 lbs. per sq. in.

Self GMD is self geometric mean distance, a function of size and shape of the conductor, for use in determining reactance voltage drop from chart on page 64.

R_{20} is DC resistance at 20°C. and 98% conductivity in microhms per foot.

The DC resistance at 70°C. and 98% conductivity in microhms per foot $= R_{20} \times 1.1925$.

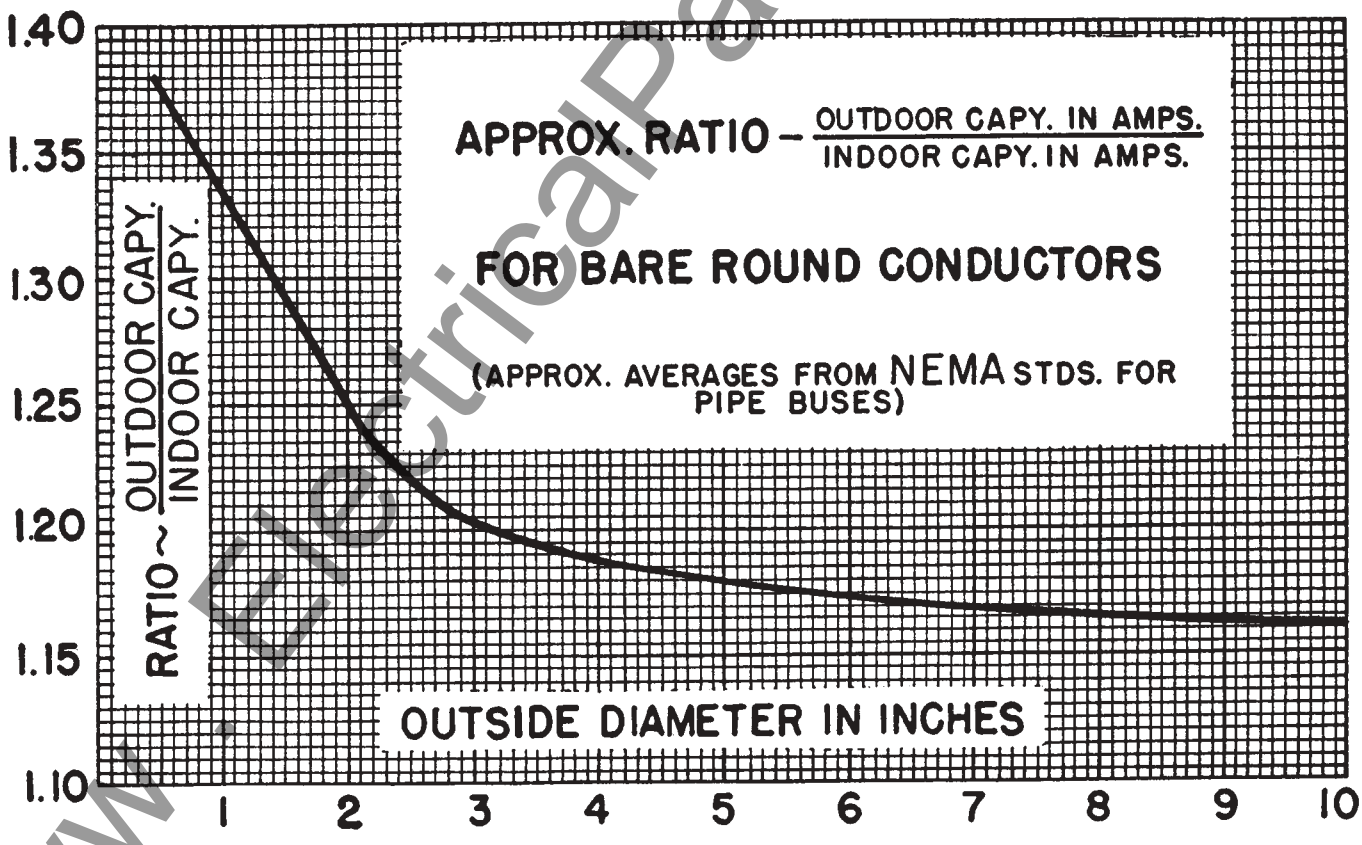
R'/R is 60 cycle skin effect ratio at 70°C.

R'_{20} is 60 cycle resistance of isolated conductor at 70°C. in microhms per ft.

$$= R_{20} \times 1.1925 \times \frac{R'}{R}$$

Ampere capacities indoors are for conductors in still air without special enclosures and a 40°C. ambient temperature. For very close phase spacing proximity effect will reduce these ratings somewhat. For approximate outdoor capacities multiply table values by the ratio of outdoor capacity to indoor capacity for the corresponding size of conductor from chart below. All resistances are based on 98% conductivity and current carrying capacities are for steady currents over long enough periods for thermal equilibrium (I^2R loss=heat dissipated).

$$\text{Ohms} = \text{microhms} \times 10^{-6}$$



*Chase Brass and Copper Company. This information pertains to tables herein used by permission of same manufacturer and does not necessarily apply to tables of other sources.

Table 76

RELATIVE CURRENT CARRYING CAPACITIES†

For conductors of the same diameter and cross section of metal, having different values of conductivity.
Conductor temperature, 70°C.

MATERIAL	CONDUCTIVITY PER CENT	RELATIVE CURRENT CARRYING CAPACITY
Copper and Copper Alloys	100	1.00
	95	0.98
	90	0.96
	85	0.94
	80	0.91
	75	0.88
	70	0.86
	65	0.83
	60	0.80
	55	0.77
	50	0.74
ALUMINUM	61	0.78
	55	0.74
	50	0.71

†NOTE: The relative current capacities at temperatures above and below 70°C. are slightly different from the values given on account of the change of temperature coefficient with conductivity. The difference will not be appreciable except for copper alloys of low conductivity, e.g., for 50% conductivity the relative current carrying capacities are 0.73 at 50°C. and 0.75 at 90°C.

REF: Frick, C. W., "Current Carrying Capacity of Bare Cylindrical Conductors for Indoor and Outdoor Service," General Electric Review, August, 1931.

Table 77

USEFUL CHARACTERISTICS OF ALUMINUM AND COPPER CONDUCTORS AT 20°C.

Characteristic	Aluminum	Copper

*Yield strength is defined as the stress which produces a permanent set of 0.5 per cent of the initial gage length.
‡By IACS is meant the International Annealed Copper Standard which is the internationally accepted value for the resistivity of annealed copper, of 100% conductivity. This value is 10.371 ohms per mil. foot at 20-degrees Centigrade, and was adopted by the International Electro-Technical Committee in 1913.

*Unless otherwise stated, all values listed are for pure metals.

†By IACS is meant the International Annealed Copper Standard which is the internationally accepted value for the resistivity of annealed copper of 100% conductivity. This value is 10.371 ohms per mil. foot at 20-degrees Centigrade, and was adopted by the International Electro-Technical Committee in 1913.

Table 83

TIME TO CHANGE SPEED OF ROTATING MASS

$$\text{Time (Sec.)} \quad \frac{WR^2 \times \text{Change in R.P.M.}}{308 \times \text{Torque (Ft. Lbs.)}}$$

$$WR^2 \text{ (disc)} = \frac{\text{Weight (Lbs.)} \times [\text{radius (ft.)}]^2}{2}$$

$$WR^2 \text{ (rim)} = \frac{\text{Wt. (Lbs.)} \times [(\text{outer rad. in ft.})^2 + (\text{inner rad. in ft.})^2]}{2}$$

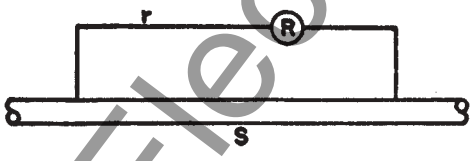
POWER TRANSMISSION BY SHAFT

$$HP = \frac{\text{Torque in ft. Lbs.} \times \text{R.P.M.}}{5250}$$

Table 84

ELECTROLYSIS – CURRENT IN PIPE LINES
PIPE LINES

$$\text{Current in Amperes} = \frac{1000\,W\,(R + r)}{R \times S \times L} \times e$$



W=Weight of pipe in pounds per ft.

L=Length of test section in feet.

R=Resistance of Voltmeter in ohms.

r=Resistance of leads in ohms.

S=Resistivity of pipe material in micro ohms per Lb. Ft. (for steel pipe S=215.8)

e=Reading on meter in millivolts.

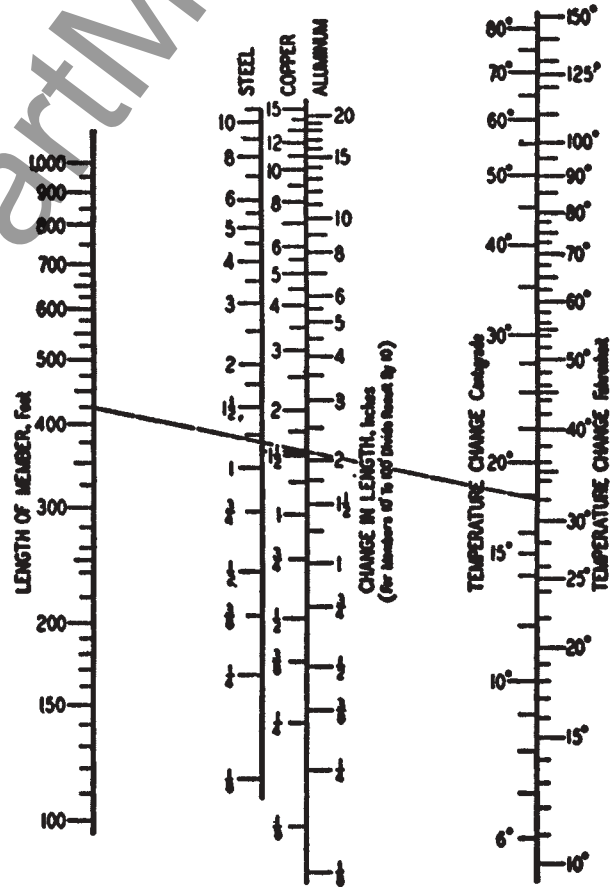
Table 85

Coefficients of linear expansion for commonly used bus supporting structures and bus materials are:

Material	per °F.	per °C.
Copper	0.00000928	0.0000168
Aluminum	0.0000128	0.0000231
Steel	0.0000067	0.0000120
Concrete	0.0000079	0.0000143
Brickwork	0.0000031	0.0000055

EXPANSION OF STEEL, COPPER AND ALUMINUM†

With Different Temperature Changes



Note that scale for steel is read opposite the steel scale on copper-aluminum scale, not where the line between the length and temperature scales crosses the steel scale.

†Prepared by W. B. Morton, of the Pennsylvania Power & Light Company, and by Basil Payne, of NEPSCO Service, Inc.

"USED BY PERMISSION."

Table 86

NUMBER OF CONDUCTORS IN CONDUIT OR TUBING

Rubber Covered, Types RF-32, RUF, R, RH, RW, RU, and RUW.

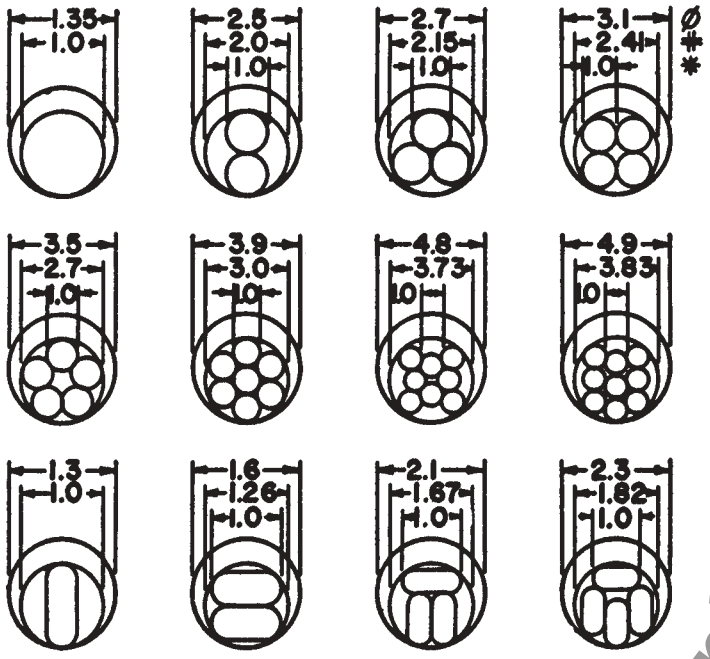
The above sizes apply to straight runs or with nominal offsets equivalent to not more than two quarter-bends.

Table 88

CONDUIT SIZES FOR CABLES

Multipliers for One or More Cables Per Conduit



Shown at left is the multiplier # for the smallest equivalent diameter of a group of cables and the multiplier Θ to determine the required internal diameter of the conduit for the same, expressed in terms of the diameter of a single cable*.

Note: The multiplier shown to obtain the required conduit diameter is for cables up to 250 MCM and runs not over 100 feet long having not more than two 90° bends or a total of 180° in bends. (More than 180° in bends between pull boxes is not recommended.)

For more difficult conduit runs, and runs having three or more cables over 250 MCM, increase the internal diameter of the conduit to 120%.

Example 1: To determine the required minimum internal diameter, in inches, of a conduit for three, #2/0—3000 volt, single conductor cables.

Diameter of one, #2/0—3000 volt cable=1.0 × .795= .795"

Minimum internal diameter of conduit=2.7 × .795= 2.146"

From table below a 2½" conduit is required.

Minimum group diameter of the three cables is 2.15 × .795=1.709"

Example 2: To determine the required minimum internal diameter, in inches, of a conduit for two, 4-conductor #9, 600 volt cables.

Diameter of one, 4-conductor #9, cable=1.0 × .788= .788"

Minimum internal diameter of conduit=2.5 × .788= 1.97"

From table below a 2" conduit is required.

Minimum group diameter of the two cables is 2.0 × .788=1.576".

STANDARD SYSTEM OF MARKING

Manufacturers of small tools, recognizing the necessity of a standard system of marking taps, dies and other threading tools, will mark their tools with the nominal size, number of threads per inch, and the proper symbol to identify the thread form.

Symbols commonly used in American practice are:

N.C.—American National Coarse Thread Series.
N.F.—American National Fine Thread Series.
N.S.—American National Special Thread Series.
N.H.T.—American National Hose Coupling Threads.
N.P.T.—American National Taper Pipe Threads.
N.P.S.—American National Straight Pipe Threads.
GREASE—Undersize Straight Pipe Threads.
STEAM—Straight Pipe Threads for Coupling Taps.
CONDUIT—Oversize Straight Pipe Threads for Coupling Taps.
V—60 degree V-Thread usually with both the crest and root flatted several thousandths from the theoretical to the user's specifications.
ACME—Standardized 29 degree Thread.
S.B.—Manufacturers' Stove Bolt Standard Thread.

H=.866025 × P=Depth of 60° sharp V-thread.

h=.649519 × P=Depth of American National form of thread.

F=.125000 × P=Width of flat at crest and root of American National Form.

f=.108253 × P=Depth of Truncation from sharp V.

*The dimensions of Type RW, RHH and THW wire. Also, these dimensions to be used for new work in computing size of conduit or tubing for combinations of wires not shown in Table 1.

** No. 14 to No. 2.

No. 18 to No. 8, solid; No. 6 and larger, stranded.

The dimensions of rubber-covered conductors in column 3 of this table are to be used in computing the size of conduit or tubing for new work for combinations not shown in Table 1. The dimensions in the last column of this table may be used only for rewiring existing raceways.

Dimensions of Lead-Covered Conductors

Types RL, RHL, and RUL

Size AWG MCM	Single Conductor		Two Conductor		Three Conductor	
	Diam. Inches	Area Sq. Ins.	Diam. Inches	Area Sq. Ins.	Diam. Inches	Area Sq. Ins.

500	1.23	1.18	. . . . .		2.59	5.28

Note – No. 14 to No. 8, solid conductors; No. 6 and larger, stranded conductors. Data for 2/64-inch insulation not yet compiled.

Varnished-Cambric Insulated Conductors

Type V

The insulation thickness for varnished-cambric conductors, Type V, is the same as for rubber-covered conductors, Type R, except for Nos. 14 and 12 which have 3/64-inch insulation for varnished-cambric, and 2/64-inch insulation for rubber-covered conductors and for No. 8 which has 3/64-inch insulation for varnished-cambric, and 4/64-inch insulation for rubber-covered conductors.

Note: The above tables give the nominal size of conductors and conduit or tubing recommended for use in computing size of conduit or tubing for various combinations of conductors. The dimensions represent average conditions only, and while variations will be found in dimensions of conductors and conduits of different manufacture, these variations will not affect the computation.

A COMPARISON OF 1987 NEC TABLES 310-16 CONDUCTORS IN RACEWAY IN FREE AIR AND 310-27 CONDUCTORS IN UNDERGROUND ELECTRICAL DUCTS.

- See NEC Article 310-15(c) and Exception No. 4 Page 168 (Exception does not apply if more than 4 conductors in a conduit).
- Total ampacities for multiple insulated conductors rated 0 through 2000 volts.
- Raceway in free air based on ambient temperature of 30°C (86°F).
- In underground electrical ducts, ampacity based on ambient earth temperature of 20°C (68°F), 100% load factor (average load divided by peak load @ a given time span), thermal resistance (RHO) of 90 for earth fill, conductor temp. 75°C (167°F), installed per NEC Table 310-1 Page 169 details 1, 2, or 3.
- **Ampacities in ( ) per 1987 NEC Page 168 note 10(c) "In a 4-W, 3∅ Wye circuit where the major portion of the load consists of electric-discharge type lighting, data processing, or similar equipment, the neutral shall be considered to be a current-carrying conductor."**

For ambient temperatures other than 30°C (86°F) for raceway in free air multiply the ampacities shown above by the appropriate factor shown for 1987 NEC Table 310-16 at the bottom of Page 153.
For ambient soil temperatures other than 20°C (68°F) for underground raceways multiply the ampacities shown above by the appropriate factor shown for 1987 Table 310-27 at the bottom of Page 162.

1987 NEC Page 169 Figure 310-1. Underground Raceway Installation Dimensions for Use with NEC Table 310-27.

Notes for all details:

1. Minimum burial depths to top electrical ducts or cables shall be in accordance with Section 300-5. Maximum depth to the top of electrical duct banks shall be 30".
2. For two and four electrical duct installations with electrical ducts installed in a single row, see the Notes to Tables 310-25 through 310-27, NEC Page 160.
3. For SI units: one inch = 25.4 millimeters; one foot = 305 millimeters.

Legend

- Backfill, maximum Rho = 90 (Earth or concrete)
- Electrical duct
- Cable or cables

AMPACITY CORRECTION FACTORS

For ambient temperatures other than 30°C (86°F), multiply the ampacities shown above by the appropriate factor shown below.

Ambient Temp. °C	THHW-THW-RHW-USE	THWN-XHHW	FEP-THHN-XHHW	Ambient Temp. °F	THHW-THW	XNNW	THHN-XHHW
21-25	1.05	1.04	1.04	70-77	1.05	1.04	1.04
26-30	1.00	1.00	1.00	79-86	1.00	1.00	1.00
31-35	.94	.96	.96	88-95	.94	.96	.96
36-40	.88	.91	.91	97-104	.88	.91	.91
41-45	.82	.87	.87	106-113	.82	.87	.87
46-50	.75	.82	.82	115-122	.75	.82	.82
51-55	.67	.76	.76	124-131	.67	.76	.76
56-60	.58	.71	.71	133-140	.58	.71	.71
61-70	.33	.58	.58	142-158	.33	.58	.58
71-80	...	.41	.41	160-176	...	.41	.41

★ Ratings for three-wire, single-phase residential service entrance and feeder conductors. (NEC Note 3 to Table 310-16 for conductor types RHH-RHW-THHW-THW-THWN-THHN-XHHW-USE.) The grounded service entrance conductor (neutral) may be two AWG sizes smaller than the ungrounded conductors provided the requirements of NEC 230-42(c) and 250-23(b) are met.

‡ On a 4-wire, 3-phase wye circuit where the major portion of the load consists of electric discharge lighting, data processing, or similar equipment, derate ampacities to 80% per notes 8 & 10 to NEC Table 310-16.

◆ #6 XHHW copper requires 1″ conduit for 3Ø4W.

● #8 XHHW copper requires ¾″ conduit for 3W.

◇ 400 MCM THHN Aluminum requires 3″ conduit for 3Ø4W.

■ Special 90°C rating for THW (14-8) within electric discharge lighting equipment per NEC Article 410-31 and Table 310-13.

▲ For panelboard circuits, wire size should be no smaller than shown above for 75°C wire. 90°C wire should be used for locations where ambient temperature above 30°C is expected, and then derated per correction factors in NEC Table 310-16.

† The overcurrent protection for conductor types marked with a dagger (†) shall not exceed 15 amperes for 14 AWG, 20 amperes for 12 AWG, and 30 amperes for 10 AWG copper; after any correction factors for ambient temperatures and number of conductors have been applied. (These are the values shown in this table.)

NEC 220-3 (a) Continuous and Noncontinuous Loads.

The branch-circuit rating shall not be less than the noncontinuous load plus 125 percent of the continuous load. (See Exception for 100% rated devices)

NEC 220-10 (b) Continuous and Noncontinuous Loads.

Where a feeder supplies continuous loads or any combination of continuous and noncontinuous loads, the rating of the overcurrent device shall not be less than the noncontinuous load plus 125 percent of the continuous load. (See Exception for 100% ratings)

The ampacity of the ungrounded service conductor shall not be less than the noncontinuous load plus 125 percent of the continuous load. (See Exceptions)

NEC 430-22 (a) Single Motor Circuit Conductors.

Branch circuit conductors supplying a single motor shall have an ampacity not less than 125 percent of the motor full-load current rating. (See Exceptions)
